Ghent

# VERY CONCISE POLITICAL HISTORY OF BELGIUM

- 18th c.: Austrian Habsburg reign
- 1795: annexation of Austrian Netherlands to France
- 1796: introduction of French territorial structures in Belgium
- 1815: « Battle of Waterloo » => Annexation of Belgium to Kingdom of the Netherlands
- 1830: Belgian revolution => foundation of the Belgian state in 1831

# WHAT IS A TERRITORIAL STRUCTURE?

- The total of subdivisions of a territory
  - Distinct separate territorial units with different functions in society: administrative, political, judicial, economic, ...
    - Demarcated units -> boundaries
    - Hierarchically structured: from nation to municipality
- Subject to change over time
  - Composite units can change without affecting the boundaries of their parts
  - The parts can have boundary changes without affecting the composition of the composite units

# WHY STUDY THE EVOLUTION OF THE TERRITORIAL STRUCTURES?

- For an accurate analysis and presentation of statistical data
  - Territorial units formed the basis for the collection of census data (National Institute for Statistics-NIS)
  - Analysis on different levels of aggregation
  - Analysis for different periods in time: longitudinal and diachronical analysis
    - => Long-term geographical analysis is possible
- As a research topic in itself (nation building processes etc.)
- Archival purposes
- ...

# EVOLUTION OF THE BELGIAN TERRITORIAL STRUCTURE

- Administrative and judicial units

- Before 1796:

1. Counties/Duchies
2. Seignouries
3. Villages

- From 1796 onwards:

1. Departments
2. Districts
3. Cantons

} composite units

4. Municipalities -> basic units of

# EVOLUTION OF THE BELGIAN TERRITORIAL UNITS

	French period (1796-1815)	Dutch period (1815-1830)	Belgian period (since 1830)
1.	9 départements	9 provinces	9/10 provinces
2.	44 judicial arrondissements 92 administrative arr.	44 judicial arrondissements 61 administrative arr. (1823)	44 judicial arrondissements 61 administrative arr.
3.	278 municipal cantons (administr. until 1800) 275 judicial cantons (after 1800)	275 judicial cantons	275 judicial cantons
4.	Continuously changing number of municipalities		

# Total number of municipalities

Primarily boundary changes

Primarily joining municipalities together into larger municipalities

## GOALS OF THE PROJECT

1. Reconstruction of the Belgian territorial structure since the end of the AR
2. Collect historical attribute data which give an extra dimension to the territorial structure
3. Make collected data available for research, education, public services, ...

# 1. RECONSTRUCTION OF THE TERRITORIAL STRUCTURE

- Geometric data:
  - Boundaries of territorial units
- Qualitative attribute data
  - Gazetteer of territorial units
  - Hierarchy of territorial units: data on functions of and relations between units
  - Evolution of territorial units: data on foundation, abolition and change
  - Composition of territorial units: data on enlargement and reduction

## 2. THE ATTRIBUTE DIMENSION

- Quantitative attribute data
  - Digitised censuses on different levels (primarily municipality level) for the whole of the area for different moments in time
- Qualitative attribute (meta)data
  - Meta-data: data on method of collection, digitisation, historical critique of censuses
  - Georeferenced maps: topographical maps, ...
  - Geocoded object data: raster objects (legal texts, orthophotos, maps), historical websites, ...

## 3. USING THE DATA

- Easy-to-use interface
  - Access via Internet
  - Interactive: add your own data, make your own queries and maps
  - For different target groups: researchers, students, teachers, genealogists,...

## STARTING POINT OF PROJECT (1)

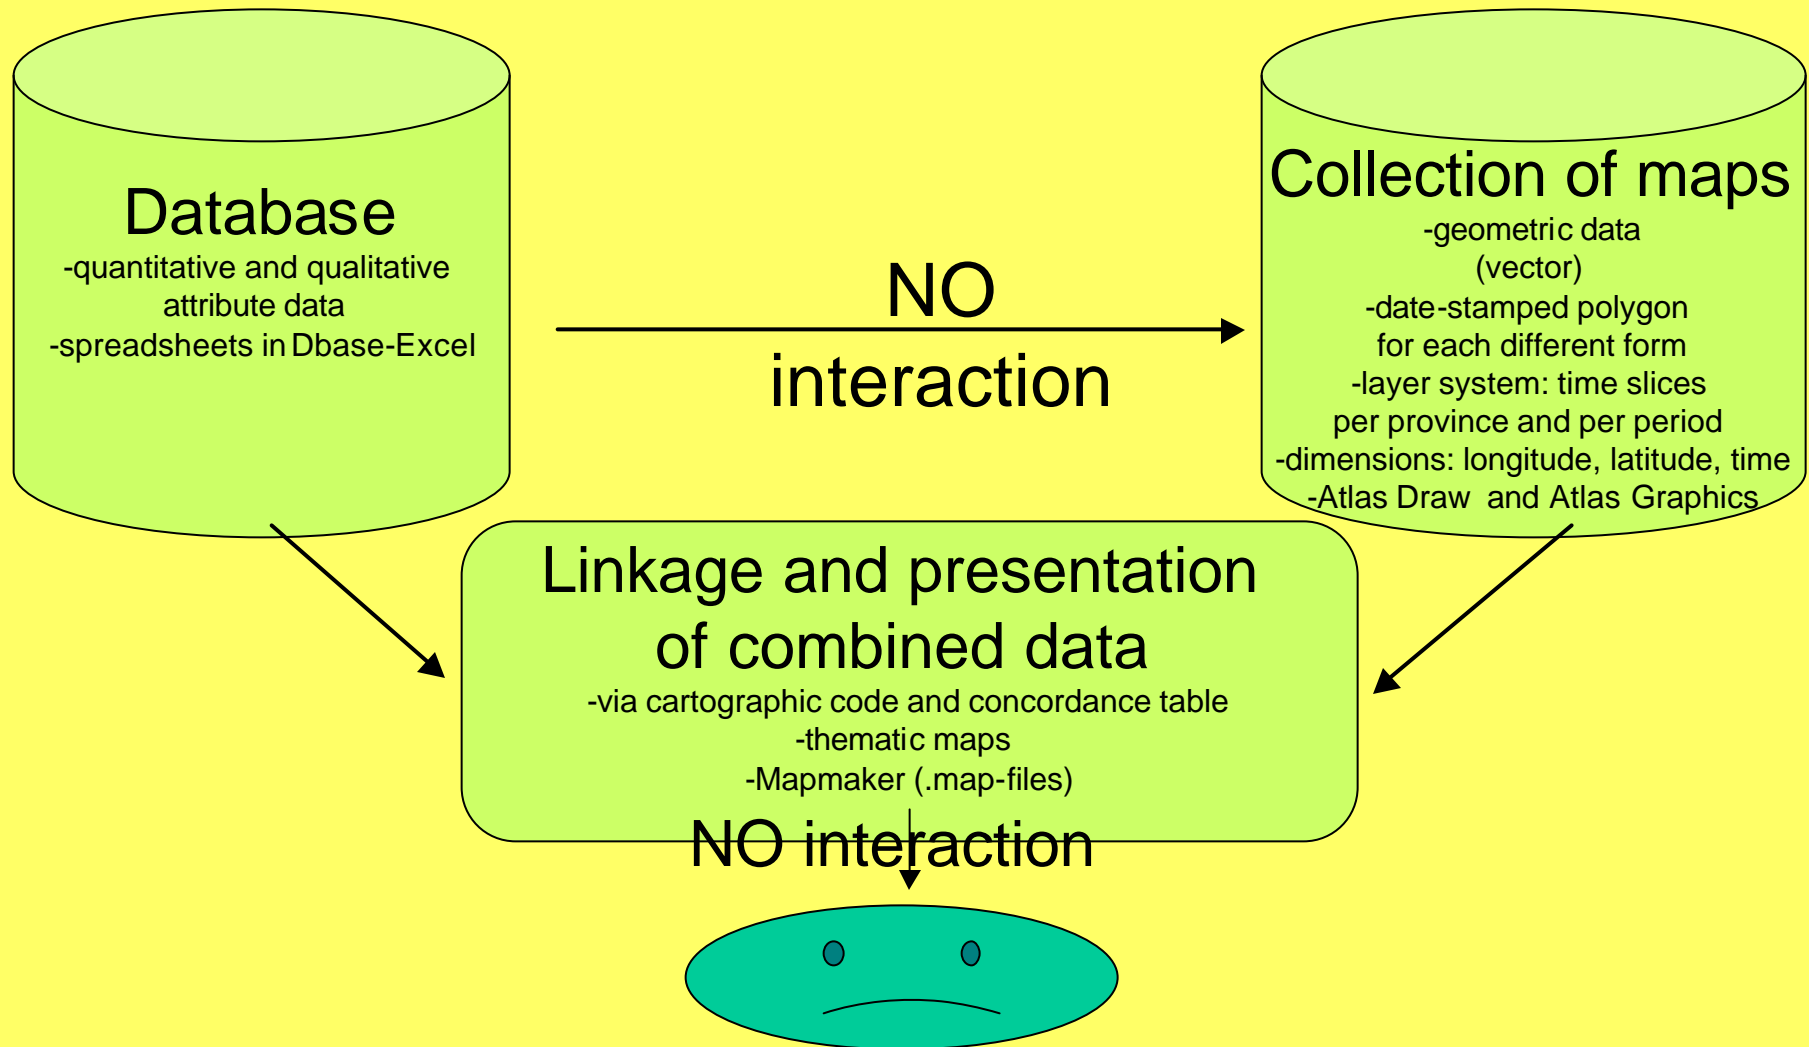

- A large collection of geographical data:
  - Geometric data: vectorised Lambert-coordinates of the boundary changes of most important territorial units for the period 1801-1991
  - Attribute data: all on the municipal level (not lower)
    - *Quantitative data*: digitised census data for period 1796-1991  
on population, agriculture, industry, ...
    - *Qualitative data*: detailed data on the geographic evolution, name, hierarchy and composition of territorial units, metadata

## STARTING POINT OF PROJECT (2)

- A simple structure (no G.I.S.) using cartographic codes and a concordance table to link spreadsheets with base-maps
- Usage of different software packages
- A complex and difficult-to-use tool for longitudinal analysis of statistical data and cartographic presentation of these data

# ORIGINAL STRUCTURE

## PROBLEMS (1)

- Limited analysis possibilities and update difficulties
- Polygons exist independent of each other which makes diachronic analyses difficult
- Excessive number of layers/polygons (high redundancy+unreliable)
- Conversion is necessary and cumbersome

## PROBLEMS (2)

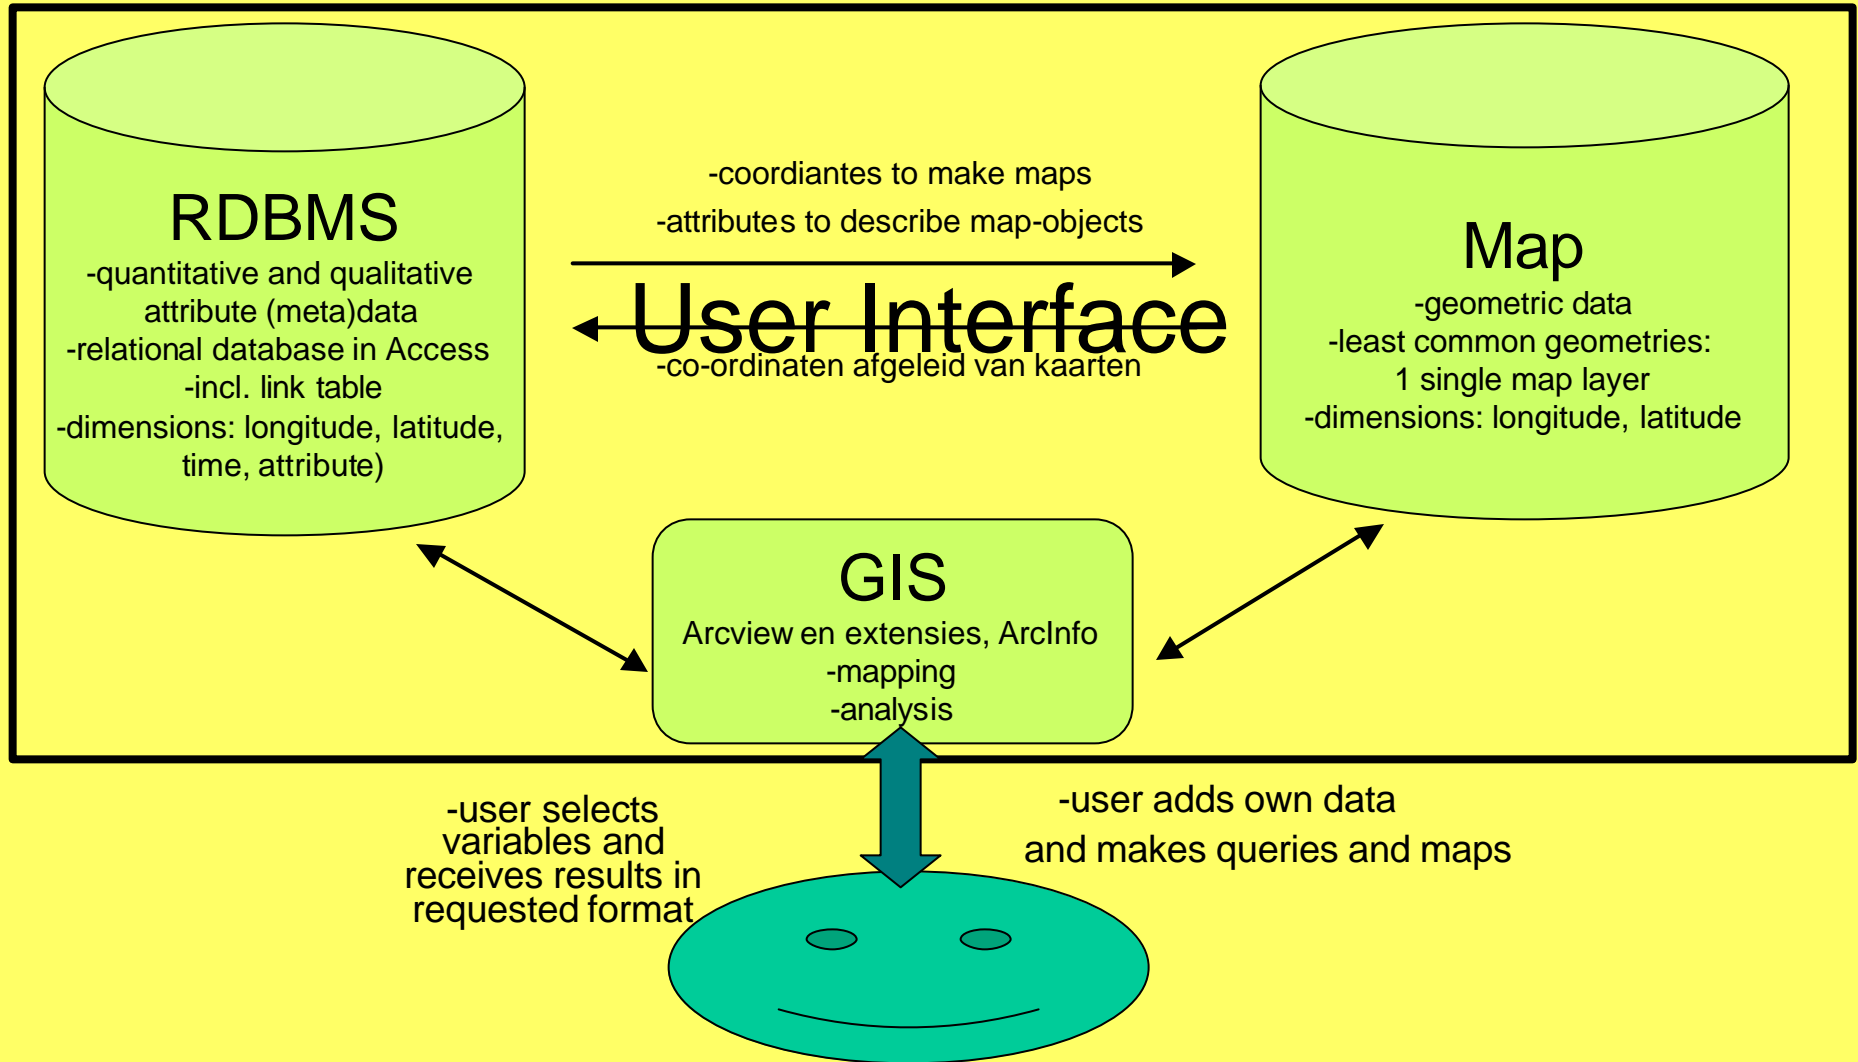

- Map units could not be integrated with topographical maps (Lambert-coordinates but map units in kilometres)
- Access by external users difficult
  - Complexity structure
  - No guidance
  - Limited infrastructure

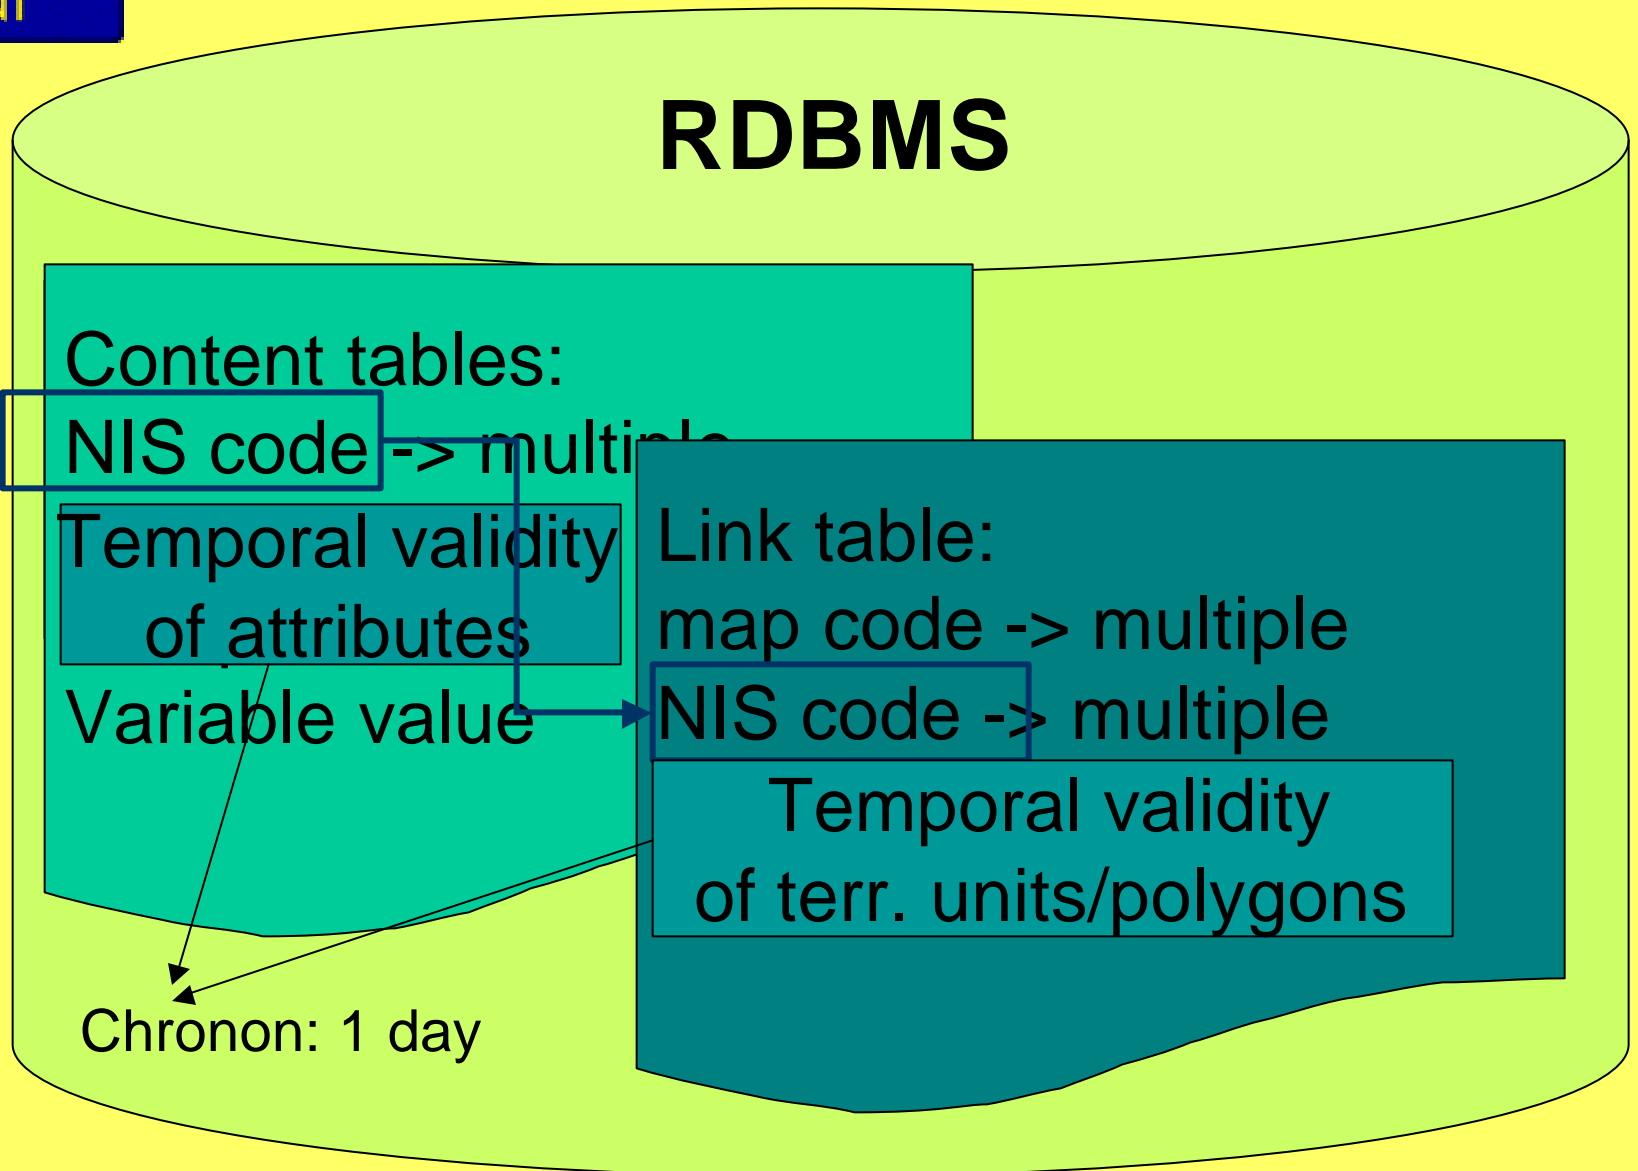

# SOLUTIONS

- Relational database: data ordered in normalised tables
- Build a G.I.S.: bring geometric data (polygons) in relation to each other
  - ! Difficulty: both attribute data and territorial units change over time and at different time periods/points!
- Use least common geometries method (LCG-method) to build map of smallest map units
- Transformation of map units into meters
- Use integrated software (MS Access + Arcview)
- Access via user-friendly interface

# NEW STRUCTURE

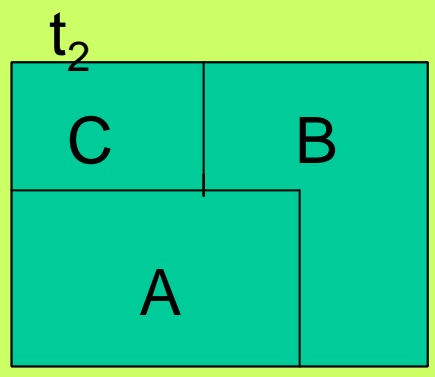

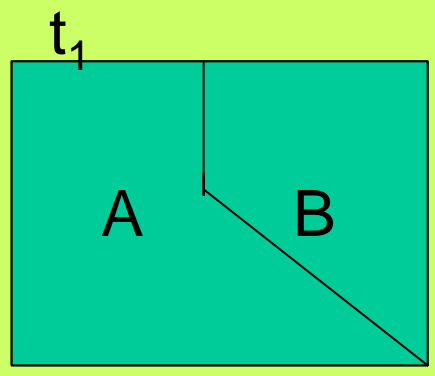

# MAP METHOD

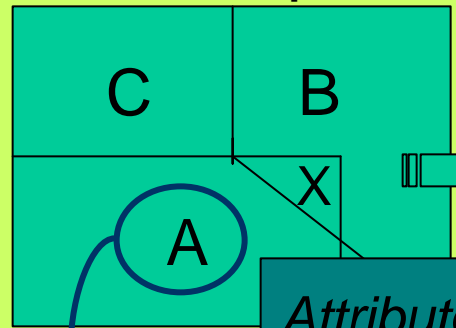

- Originally: simple layer model:  
New polygons with new ID-codes for every new form of a territorial unit
- New method: from spaghetti map to least common geometries map\*:
  1. Time slices of layer model are overlaid  
=>spaghetti-file
  2. Intersection of all spatial objects (polygons)  
=> new objects => map of smallest map units
  3. New layers are made by activating right objects
    - Types: space-time-composite with polygons or with lines

\*Ott & Swiaczny, *Time-integrative GIS*, 2001

# Map of least common geometries

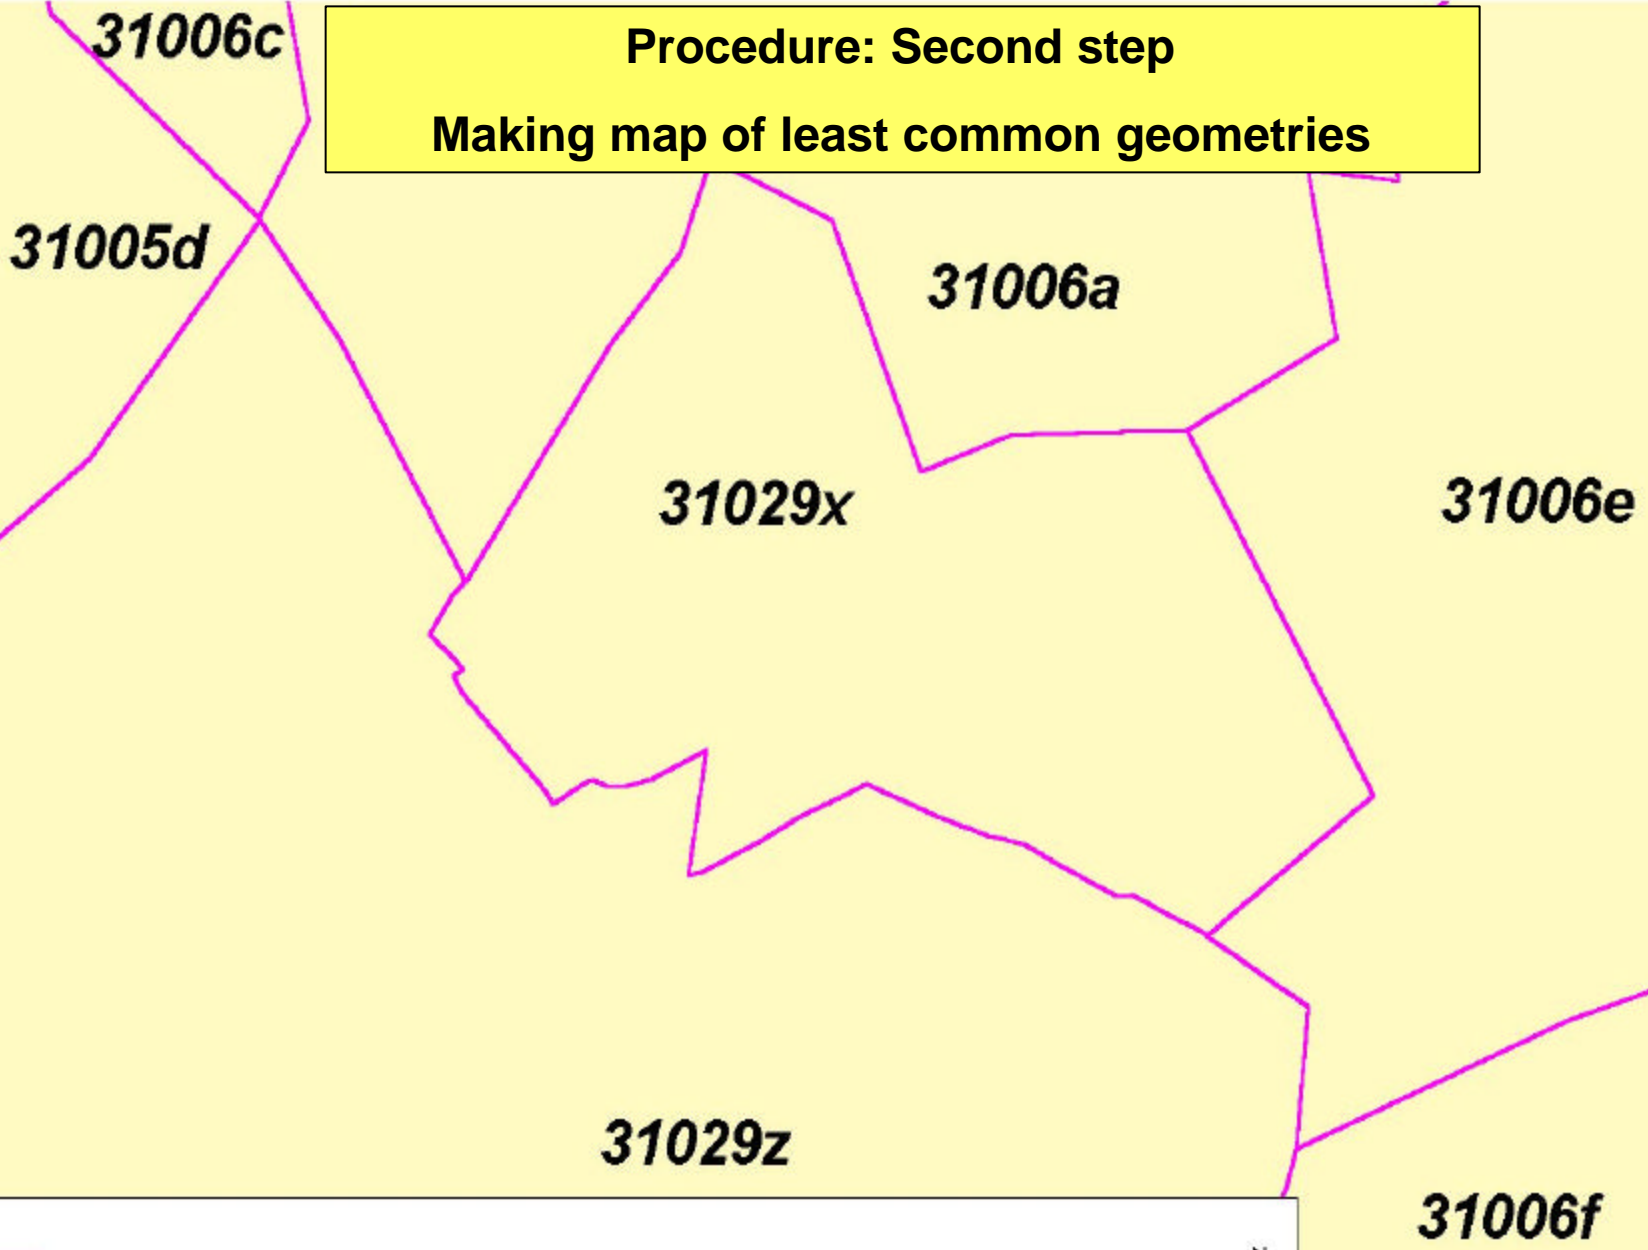

Overlay and  
intersection => 1  
map layer of  
smallest map units

$t_1$  A:  $A+C+Y$ ;  
B:  $B+X$   
 $t_2$  A:  $A+X$ ;

*Attribute table of map*  
map code: unique  
Area  
Perimeter  
X-coordinates  
Y-coordinates  
...

**Procedure: Second step**  
**Making map of least common geometries**

 *Least common geometry*

0 250 500 750 1000 Meters

Multiple

## ADVANTAGES OF LCG-METHOD

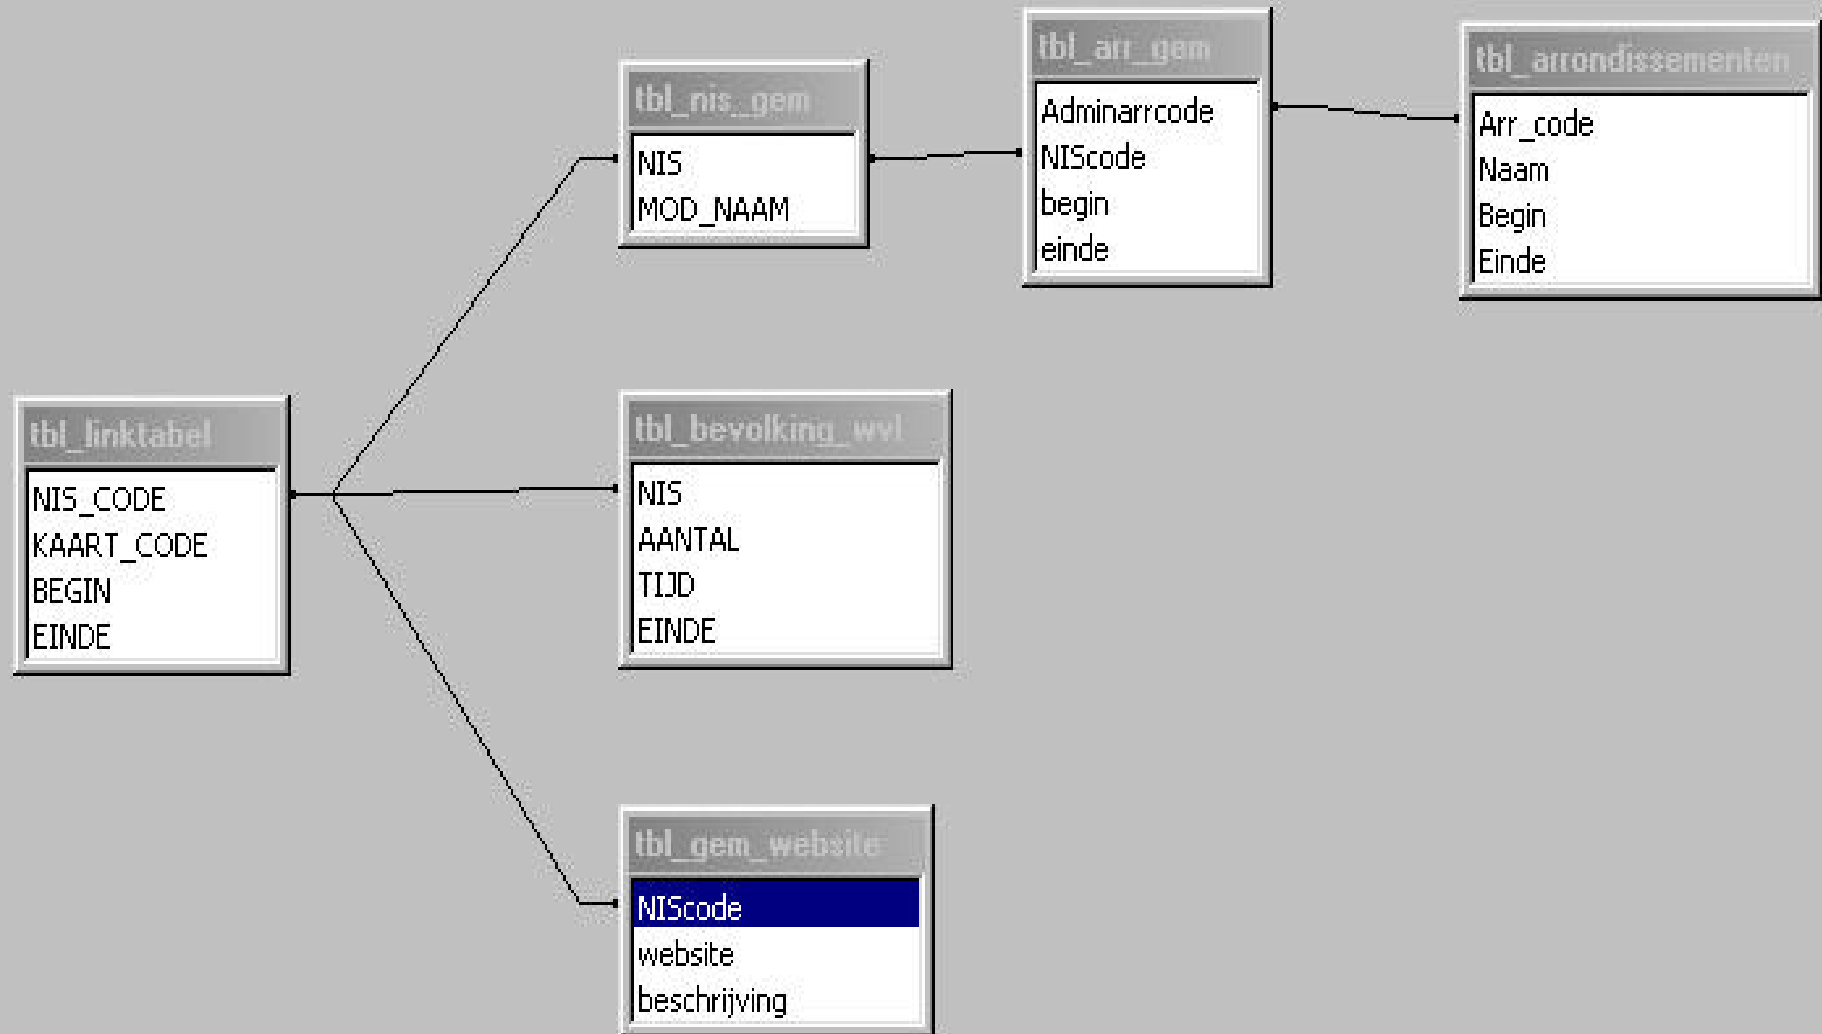

- Spatially and temporally reliable
- Can generate boundaries for each given time point
- Covers time slices and continual records of change
- No redundant information
- Can be implemented with each layer GIS
- High versatility and flexibility of analysis

# Example 1

The evolution of the boundaries of the administrative arrondissements for the province of West-Flanders

Brugge (Bruges)

The image shows a screenshot of the ArcView GIS software interface. The main window displays an aerial photograph of the city of Brugge (Bruges) in Belgium. A red line outlines the city's boundary. The text 'Brugge (Bruges)' is overlaid on the center of the image. The left sidebar shows a list of data layers, including 'Municipalities 1846', 'Arrondissements 1820', and various TIFF files. The top menu bar includes 'File', 'Edit', 'View', 'Theme', 'Graphics', 'Window', and 'Help'. The top toolbar contains various GIS tools. The bottom status bar shows the Windows taskbar with several open applications and the system clock at 15:55.

# INTERFACE

- Distribution of data
- Collection of data
- Access via internet
- Special viewer for MS-Access and Arcview
- ArcIMS-server
- Restricted access? Copyright?

## POSSIBLE CRITIQUE

- Flexibility can be enhanced:  
Instead of map layers (“complex” maps/simple database): spatial databases (more complex database /simpler maps)
- User can use and enter data but not change the structure of database

## FUTURE PERSPECTIVES

- Add more data on all territorial levels
- Extension in time: link to Ancien Regime
- Linkage with databases of public services
- Integration into a historical data and metadata archive for geographical and non-geographical historical data
